JavaScript Best Practices

[« Previous](#)

Avoid global variables, avoid new, avoid ==, avoid eval()

Avoid Global Variables

Minimize the use of global variables.

This includes all data types, objects, and functions.

Global variables and functions can be overwritten by other scripts.

Use local variables instead, and learn how to use [closures](#).

No more classname collisions

- **Much** easier to come up with descriptive names
- You don't have to worry about breaking other modules

Explicit style dependency

- No separate “styling” concept

My app

```
graph TD; A[My app] --- B[<MyApp />]; A --- C[CSS styles]; B --- D[<Page /> logic + markup]; B --- E[<Header /> logic + markup]; B --- F[<Button /> logic + markup];
```

The diagram illustrates the structure of 'My app'. It branches into two main components: a markup component and a styling component. The markup component is represented by the `<MyApp />` tag, which contains nested elements like `<Page />`, `<Header />`, and `<Button />`. Each of these nested elements is associated with 'logic + markup'. The styling component is represented by 'CSS styles'.

`<MyApp />`

CSS styles

`<Page />` logic + markup

`<Header />` logic + markup

`<Button />` logic + markup

My app

<MyApp />

<Page /> logic + markup + page styles

<Header /> logic + markup + header styles

<Button /> logic + markup + button styles

Explicit style dependency

- No separate “styling” concept
- Easy use third party components

Separation of real CSS classes

- You can refactor your CSS without having to modify your components
- It is possible to automatically optimize CSS and remove unused styles
